#### 2017 USENIX Annual Technical Conference

#### Visualizing Performance with Flame Graphs

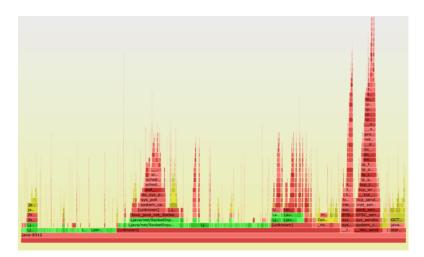

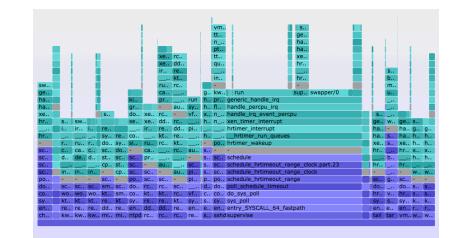

### Agenda

#### 1. CPU Flame graphs

2. Fixing Stacks & Symbols

3. Advanced flame graphs

### Take aways

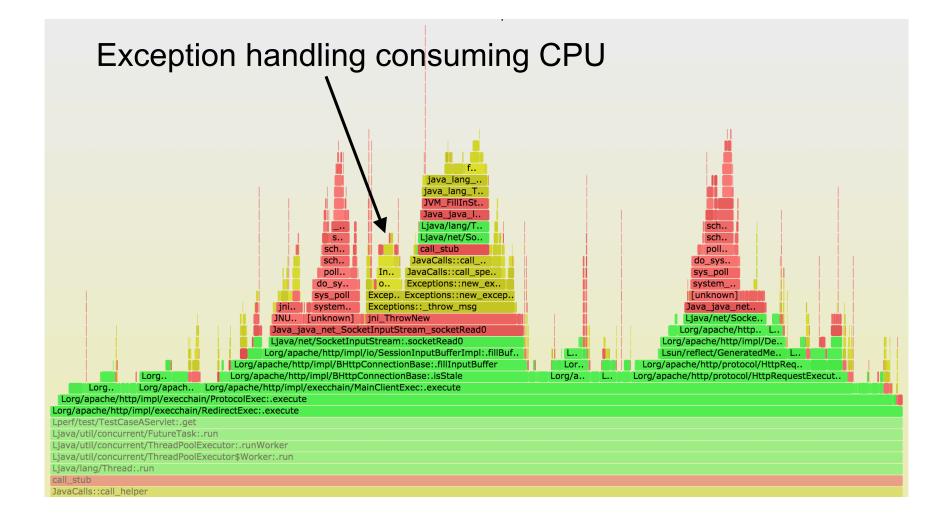

- 1. Interpret CPU flame graphs
- 2. Understand pitfalls with stack traces and symbols
- 3. Discover opportunities for future development

**REGIONS WHERE NETFLIX IS AVAILABLE** 

#### **Case Study**

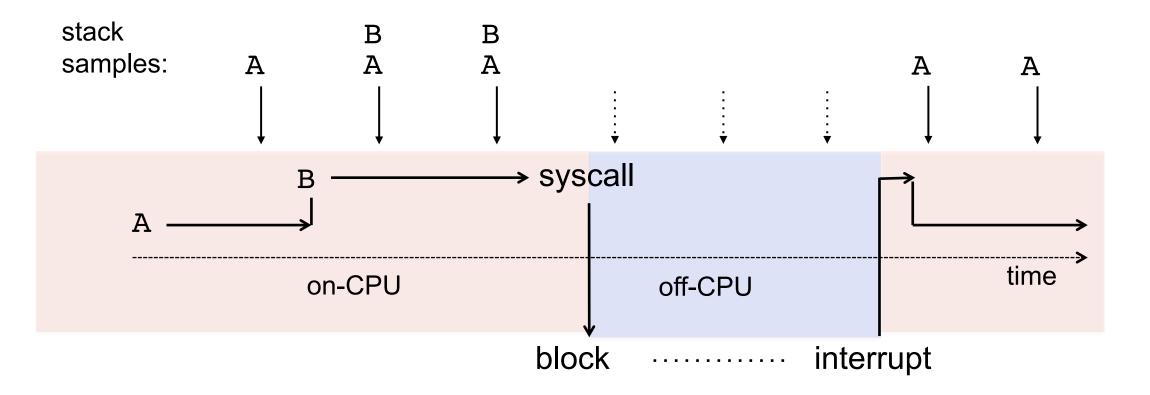

Summary

# **CPU PROFILING**

## **CPU** Profiling

- Record stacks at a timed interval: simple and effective
  - Pros: Low (deterministic) overhead
  - Cons: Coarse accuracy, but usually sufficient

#### Stack Traces

• A code path snapshot. e.g., from jstack(1):

```
$ jstack 1819
[...]
"main" prio=10 tid=0x00007ff304009000 nid=0x7361
runnable [0x00007ff30d4f9000]
java.lang.Thread.State: RUNNABLE
    at Func_abc.func_c(Func_abc.java:6)
    at Func_abc.func_b(Func_abc.java:16)
    at Func_abc.func_a(Func_abc.java:23)
    at Func_abc.main(Func_abc.java:27)
    running
    parent
    g.g.parent
```

## System Profilers

- Linux
  - perf\_events (aka "perf")
- Oracle Solaris
  - DTrace
- OS X
  - Instruments
- Windows
  - XPerf, WPA (which now has flame graphs!)
- And many others...

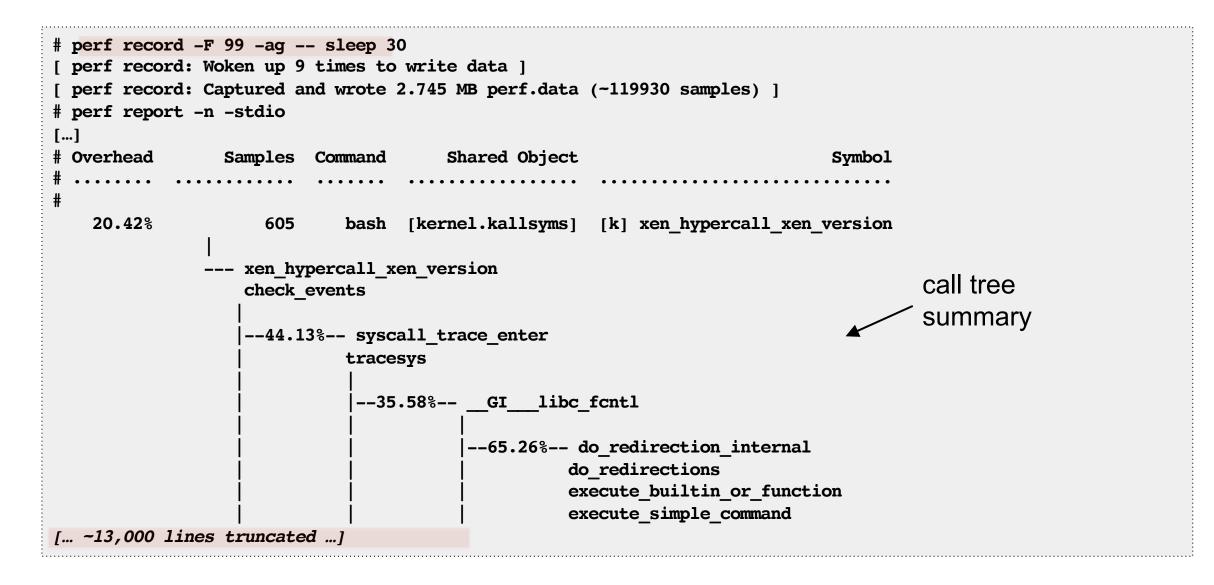

## Linux perf\_events

- Standard Linux profiler
  - Provides the perf command (multi-tool)
  - Usually pkg added by linux-tools-common, etc.

#### • Many event sources:

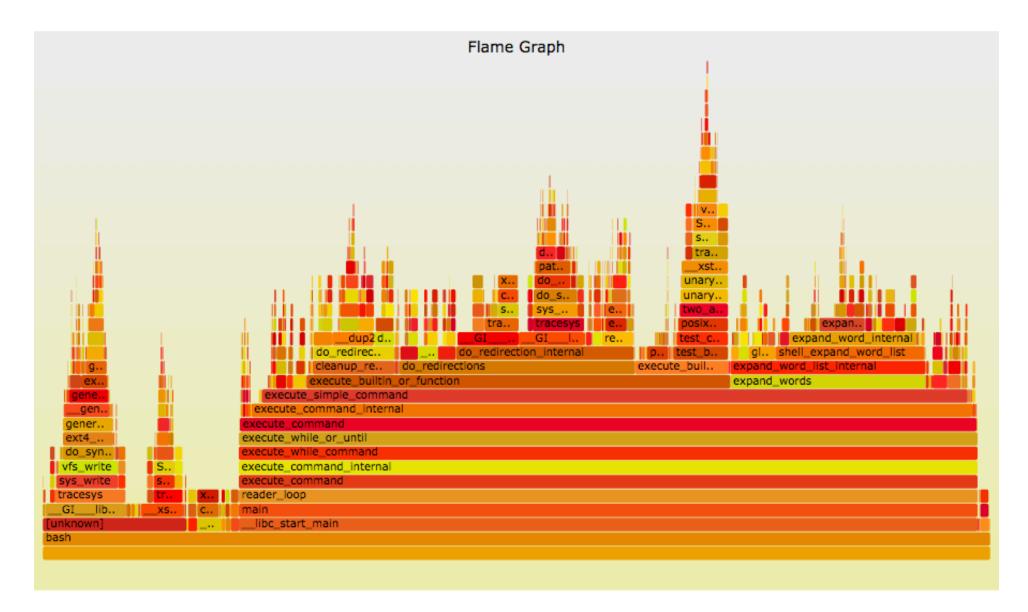

- Timer-based sampling
- Hardware events
- Tracepoints
- Dynamic tracing
- Can sample stacks of (almost) everything on CPU
  - Can miss hard interrupt ISRs, but these should be near-zero. They can be measured if needed (I wrote my own tools).

### perf Profiling

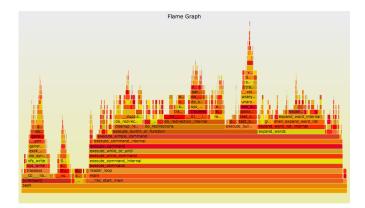

#### Full perf report Output

#### ... as a Flame Graph

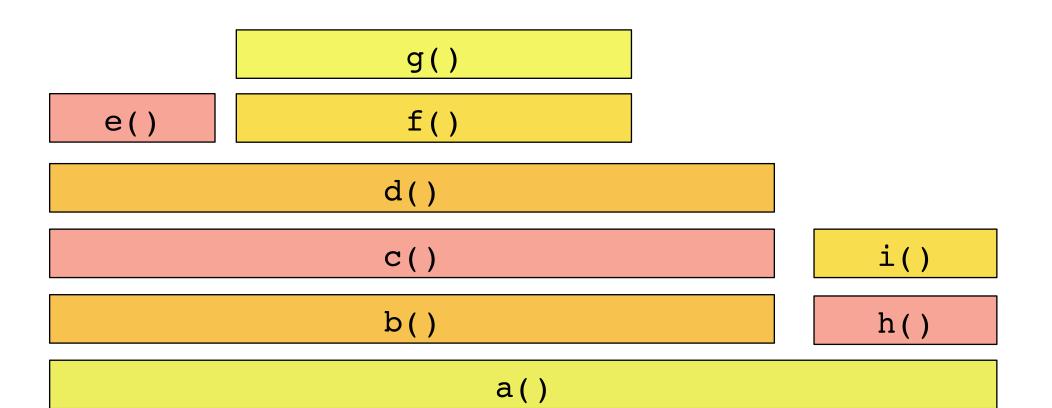

## Flame Graph Summary

- Visualizes a collection of stack traces
  - x-axis: alphabetical stack sort, to maximize merging
  - y-axis: stack depth
  - **color**: random (default), or a dimension
- Currently made from Perl + SVG + JavaScript
  - https://github.com/brendangregg/FlameGraph
  - Takes input from many different profilers
  - Multiple d3 versions are being developed
- References:
  - http://www.brendangregg.com/FlameGraphs/cpuflamegraphs.html
  - http://queue.acm.org/detail.cfm?id=2927301
  - "The Flame Graph" CACM, June 2016

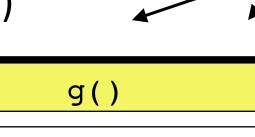

#### Flame Graph Interpretation

## Flame Graph Interpretation (1/3)

Top edge shows who is running on-CPU,

and how much (width)

e()	f()

d()	

b()

C()	i()

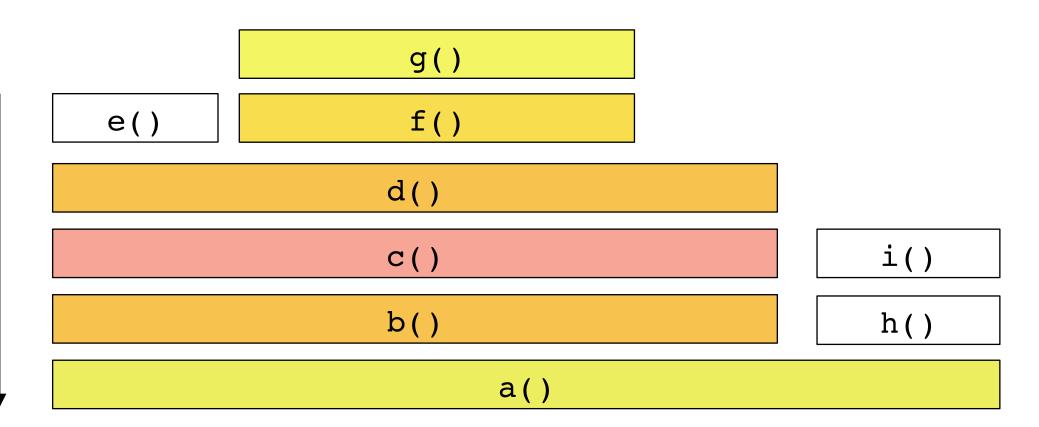

h()	
-----	--

a()

## Flame Graph Interpretation (2/3)

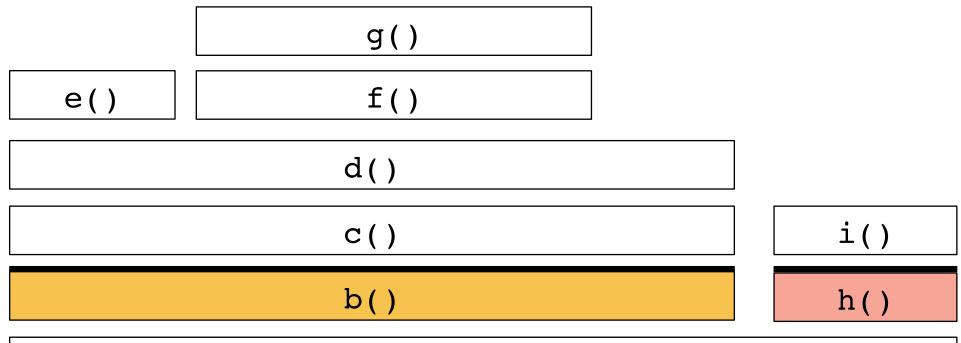

Top-down shows ancestry

e.g., from g():

## Flame Graph Interpretation (3/3)

Widths are proportional to presence in samples e.g., comparing b() to h() (incl. children)

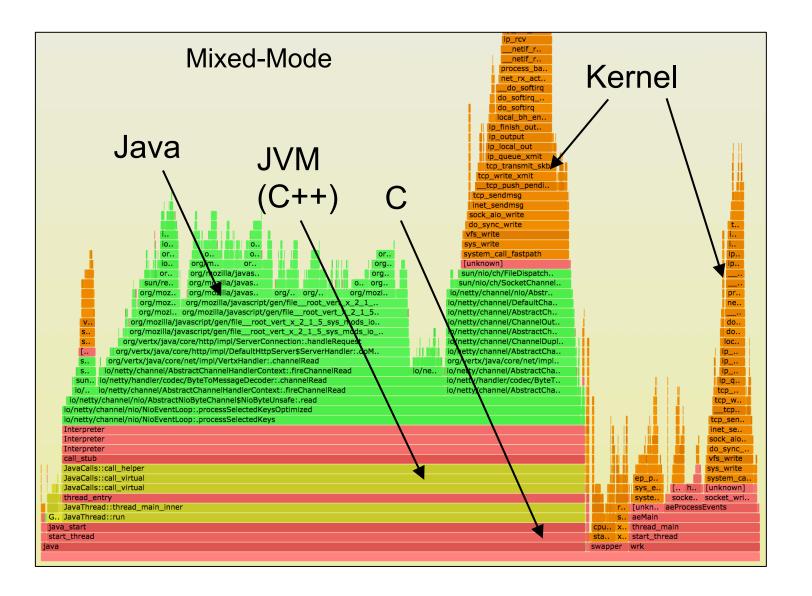

a()

## Mixed-Mode Flame Graphs

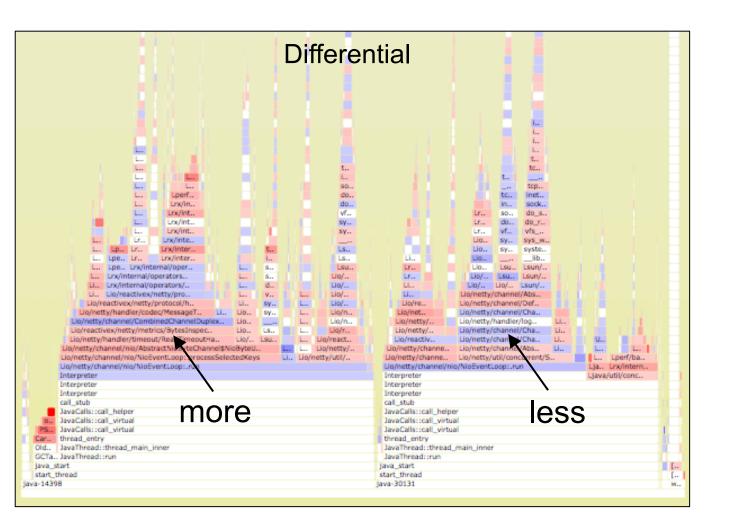

- Hues:
  - green == JIT (eg, Java)
  - aqua == inlined
    - if included
  - red == user-level\*
  - orange == kernel
  - yellow == C++
- Intensity:
  - Randomized to differentiate frames
  - Or hashed on function name

\* new palette uses red for kernel modules too

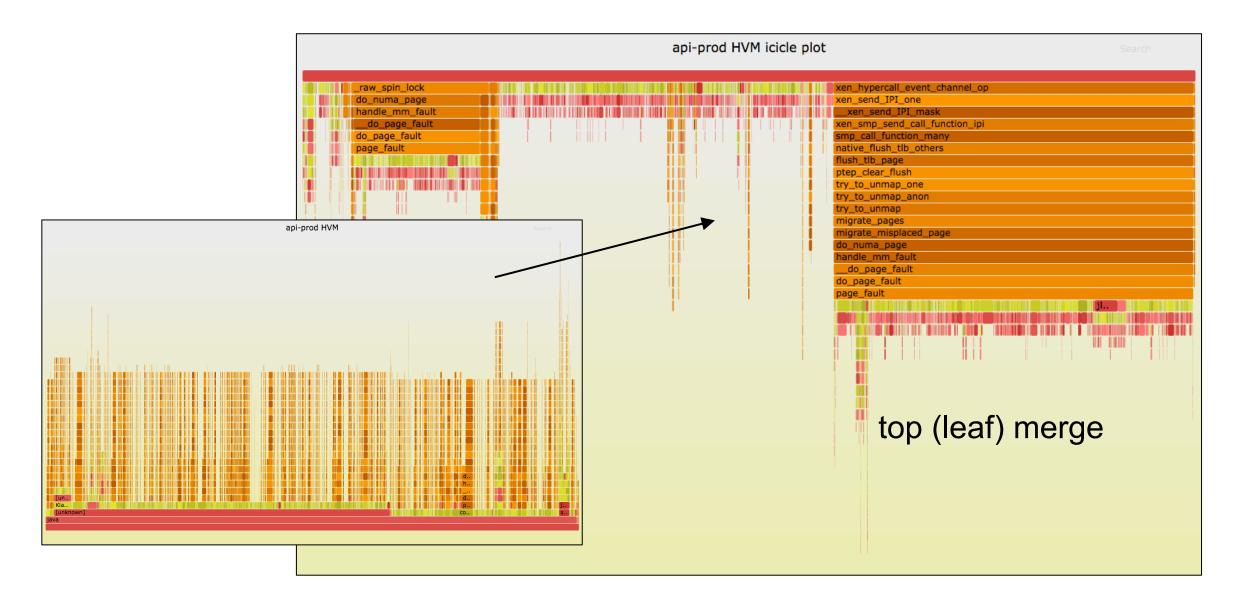

## **Differential Flame Graphs**

- Hues:
  - red == more samples
  - blue == less samples
- Intensity:
  - Degree of difference
- Compares two profiles
- Can show other metrics: e.g., CPI
- Other types exist
  - flamegraphdiff

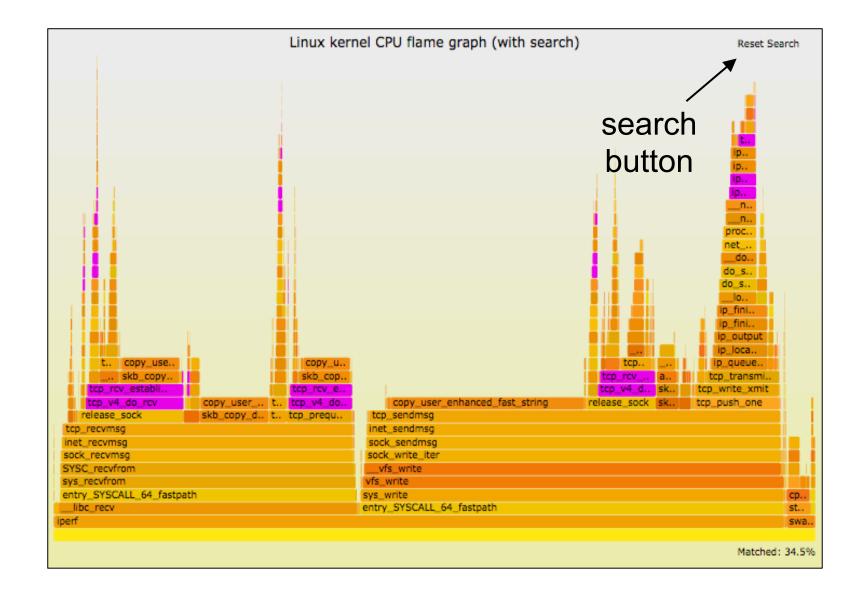

### Icicle Graph

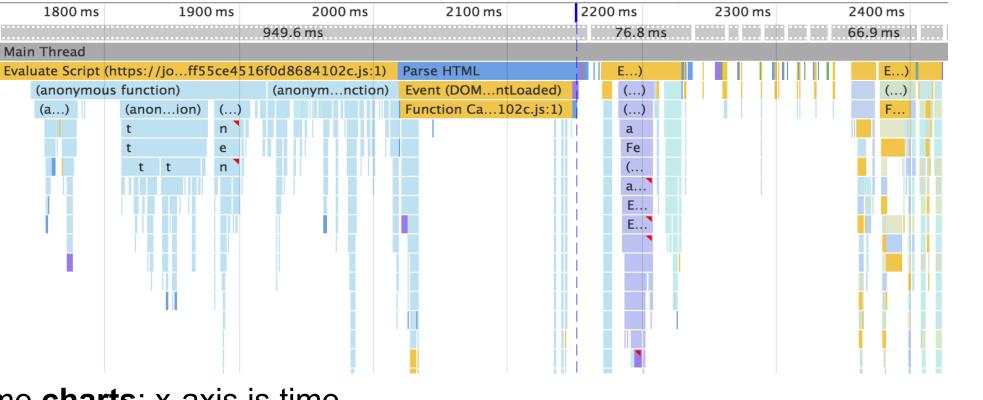

## Flame Graph Search

 Color: magenta to show matched frames

## Flame Charts

• Final note: these are useful, but are not flame graphs

- Flame **charts**: x-axis is time
- Flame graphs: x-axis is population (maximize merging)

from Chrome dev tools

Pitfalls and fixes

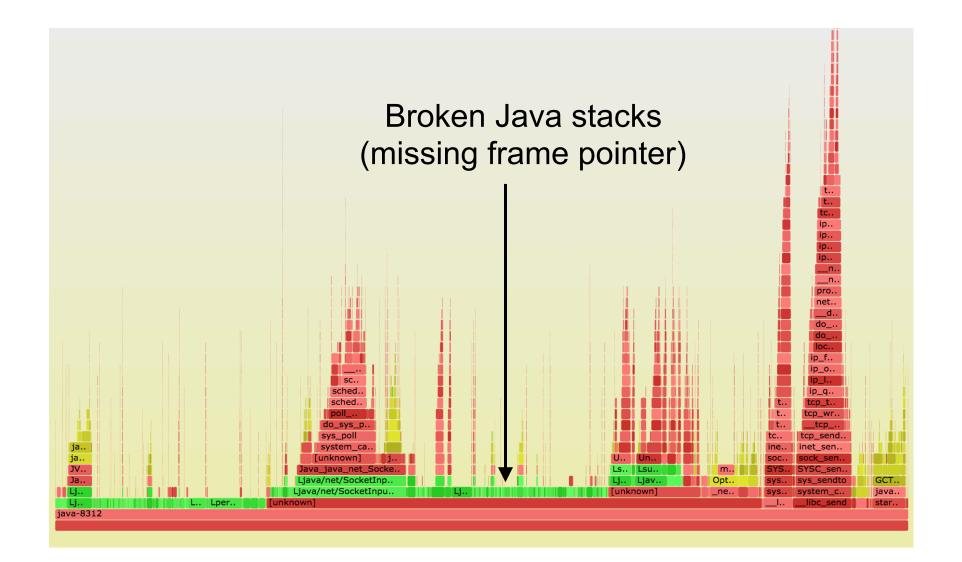

# **STACK TRACING**

### Broken Stack Traces are Common

#### Because:

- A. Profilers use frame pointer walking by default
- B. Compilers reuse the frame pointer register as a general purpose register: a (usually very small) performance optimization.

#### ... as a Flame Graph

## Fixing Stack Walking

#### A. Frame pointer-based

- Fix by disabling that compiler optimization: gcc's -fno-omit-frame-pointer
- Pros: simple, supported by many tools
- Cons: might cost a little extra CPU

#### B. Debug info (DWARF) walking

– Cons: costs disk space, and not supported by all profilers. Even possible with JIT?

#### C. JIT runtime walkers

- Pros: include more internals, such as inlined frames
- Cons: limited to application internals no kernel

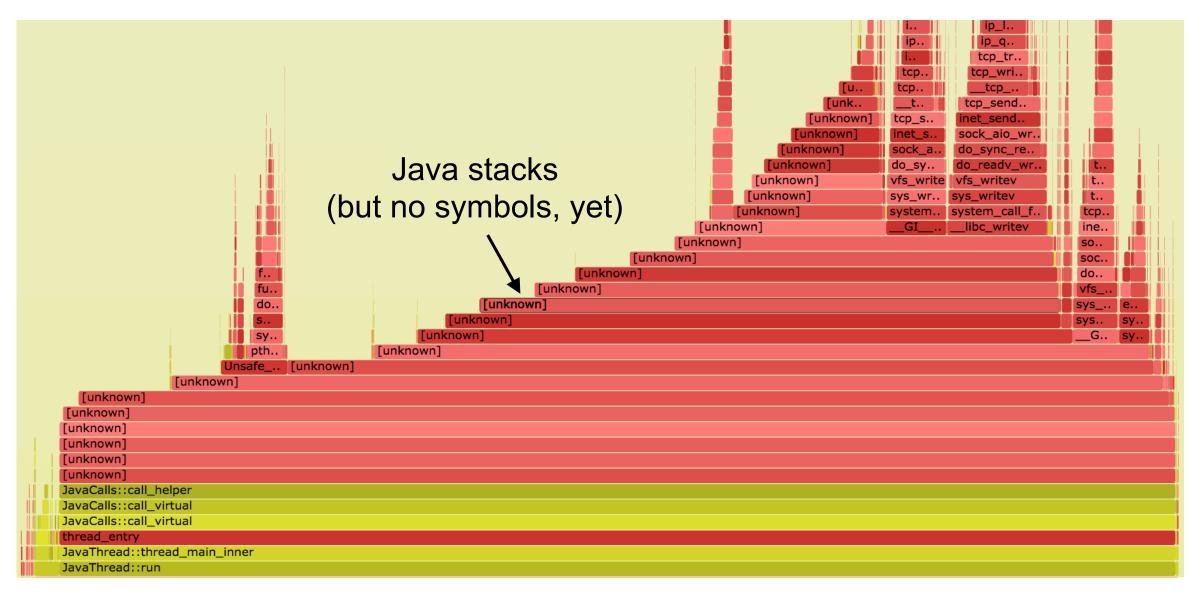

#### D. Last branch record

#### **Fixing Java Stack Traces**

I prototyped JVM frame pointers. Oracle rewrote it and added it to Java as -XX:+PreserveFramePointer (JDK 8 u60b19)

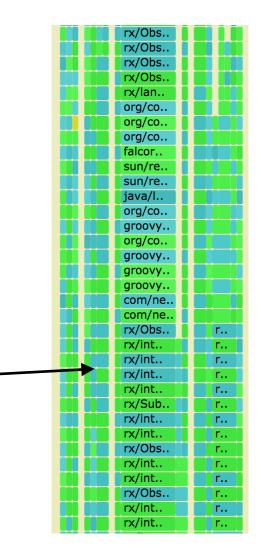

# p	erf script

	7fd3173f6f52	java_start(Thread*) (/usr/lib/jvm/
	7fd317a7e182	start_thread (/lib/x86_64-linux-gn

#### Fixed Stacks Flame Graph

## Inlining

- Many frames may be missing (inlined)
  - Flame graph may still make enough sense
- Inlining can often be be tuned
  - e.g. Java's -XX:-Inline to disable, but can be 80% slower
  - Java's -XX:MaxInlineSize and -XX:InlineSmallCode can be tuned a little to reveal more frames: can even improve performance!
- Runtimes can un-inline on demand
  - So that exception stack traces make sense
  - e.g. Java's perf-map-agent can un-inline (unfoldall option)

### Stack Depth

broken stacks

- perf had a 127 frame limit
  - Now tunable in Linux 4.8
    - sysctl -w kernel.perf\_event\_max\_stack=512
    - Thanks Arnaldo Carvalho de Melo!

A Java microservice with a stack depth of > 900

perf\_event\_max\_stack=1024

# SYMBOLS

Fixing

## **Fixing Native Symbols**

- A. Add a -dbgsym package, if available
- B. Recompile from source

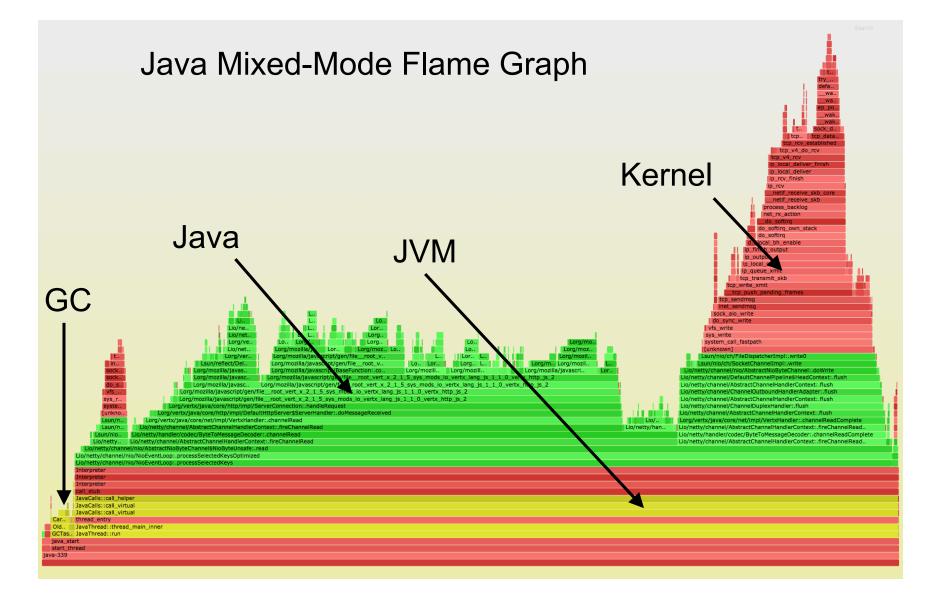

## Fixing JIT Symbols (Java, Node.js, ...)

- Just-in-time runtimes don't have a pre-compiled symbol table
- So Linux perf looks for an externally provided JIT symbol file: /tmp/perf-PID.map

```
# perf script
Failed to open /tmp/perf-8131.map, continuing without symbols
[...]
java 8131 cpu-clock:
    7fff76f2dce1 [unknown] ([vdso])
    7fd3173f7a93 os::javaTimeMillis() (/usr/lib/jvm...
    7fd301861e46 [unknown] (/tmp/perf-8131.map)
[...]
```

• This can be created by runtimes; eg, Java's perf-map-agent

#### Fixed Stacks & Symbols

#### Stacks & Symbols (zoom)

	in the second seco	

## Symbol Churn

- For JIT runtimes, symbols can change during a profile
- Symbols may be mistranslated by perf's map snapshot
- Solutions:
  - A. Take a before & after snapshot, and compare
  - B. perf's new support for timestamped symbol logs

#### Containers

- perf can't find any symbol sources
  - Unless you copy them into the host
- I'm testing Krister Johansen's fix, hopefully for Linux 4.13
  - Ikml: "[PATCH tip/perf/core 0/7] namespace tracing improvements"

For Linux

# INSTRUCTIONS

## Linux CPU Flame Graphs

#### Linux 2.6+, via perf.data and perf script:

```
git clone --depth 1 https://github.com/brendangregg/FlameGraph
cd FlameGraph
perf record -F 99 -a -g -- sleep 30
perf script | ./stackcollapse-perf.pl |./flamegraph.pl > perf.svg
```

#### Linux 4.5+ can use folded output

 Skips the CPU-costly stackcollapse-perf.pl step; see: http://www.brendangregg.com/blog/2016-04-30/linux-perf-folded.html

#### Linux 4.9+, via BPF:

git clone --depth 1 https://github.com/brendangregg/FlameGraph
git clone --depth 1 https://github.com/iovisor/bcc
./bcc/tools/profile.py -dF 99 30 | ./FlameGraph/flamegraph.pl > perf.svg

Most efficient: no perf.data file, summarizes in-kernel

## Linux Profiling Optimizations

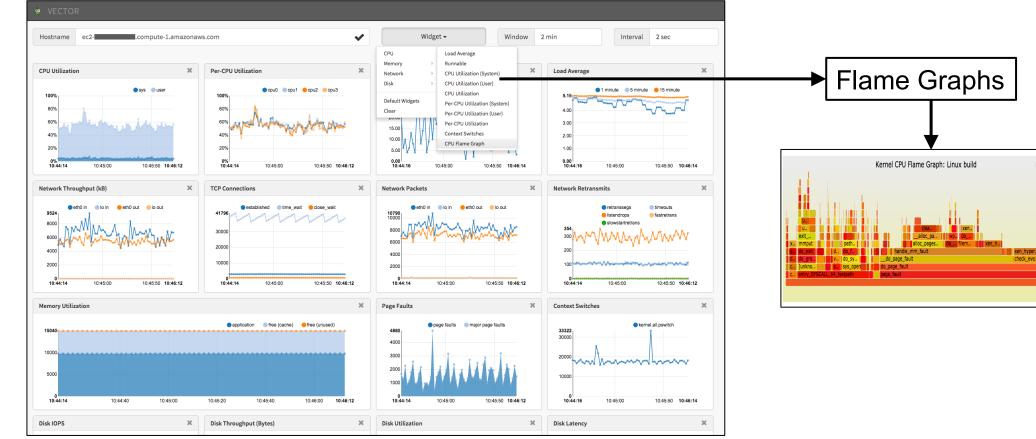

## Language/Runtime Instructions

- Each may have special stack/symbol instructions
  - Java, Node.js, Python, Ruby, C++, Go, ...
- I'm documenting some on:
  - <u>http://www.brendangregg.com/FlameGraphs/cpuflamegraphs.html</u>
  - Also try an Internet search

#### **GUI** Automation

#### Eg, Netflix Vector (self-service UI):

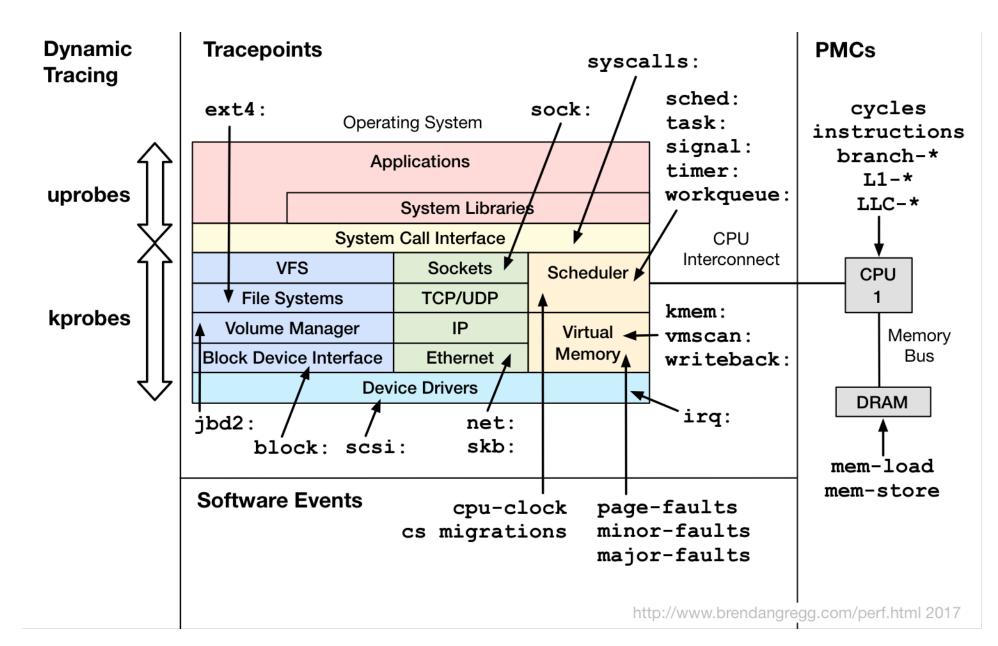

Should be open sourced; you may also build/buy your own

Future Work

# **ADVANCED FLAME GRAPHS**

#### Flame graphs can be generated for stack traces from any Linux event source

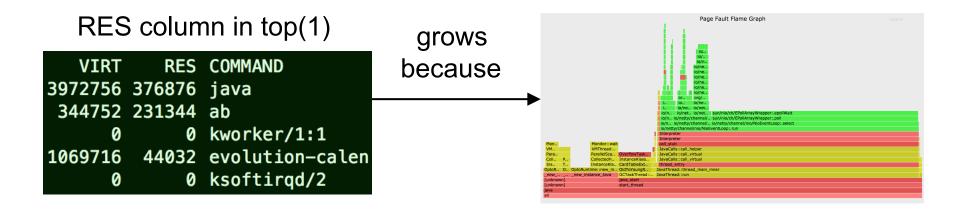

#### Page Faults

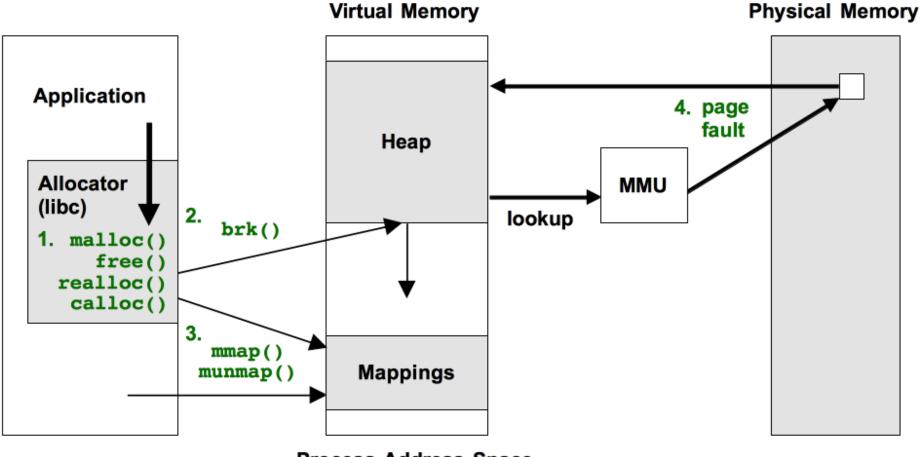

• Show what triggered main memory (resident) to grow:

# perf record -e page-faults -p PID -g -- sleep 120

- "fault" as (physical) main memory is allocated on-demand, when a virtual page is first populated
- Low overhead tool to solve some types of memory leak

### **Other Memory Sources**

**Process Address Space** 

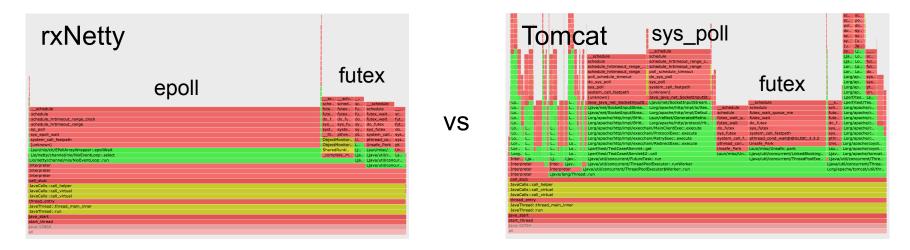

http://www.brendangregg.com/FlameGraphs/memoryflamegraphs.html

#### **Context Switches**

• Show why Java blocked and stopped running on-CPU:

# perf record -e context-switches -p PID -g -- sleep 5

- Identifies locks, I/O, sleeps
  - If code path shouldn't block and looks random, it's an involuntary context switch. I could filter these, but you should have solved them beforehand (CPU load).
- e.g., was used to understand framework differences:

## Disk I/O Requests

- Shows who issued disk I/O (sync reads & writes):
- # perf record -e block:block\_rq\_insert -a -g -- sleep 60
- e.g.: page faults in GC? This JVM has swapped out!:

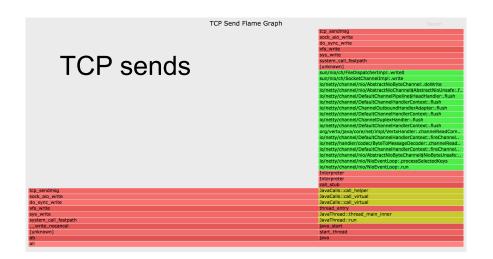

Reset Zoom	Block I/O Flame Graph		
		elv_add_request	
		blk_flush_plug_list	
00		blk_finish_plug	
GC		do_page_cache_readahead	
		ra_submit	
		filemap_fault	
		do_fault	
		handle_mm_fault	
elv_add_request		do_page_fault	
blk_flush_plug_list	elv_add_request	do_page_fault	
blk_finish_plug	blk_flush_plug_list	page_fault	
do_page_cache_readahead	blk_finish_plug	JVM_MonitorWait	
ra_submit	swapin_readahead	Interpreter	
filemap_fault	handle_mm_fault	Interpreter	
do_fault	do_page_fault	Interpreter	
handle_mm_fault	do_page_fault	call_stub	
do_page_fault	page_fault	JavaCalls::call_helper	
do_page_fault	OverflowTaskQueueS	JavaCalls::call_virtual	
page_fault	InstanceKlass::oop	JavaCalls::call_virtual	
ParCompactionManager::push_objarray	CardTableExtension::	thread_entry	
MarkFromRootsTask::do_it	OldToYoungRootsTas	JavaThread::thread_main_inner	
GCTaskThread::run		JavaThread::run	
java_start			
start_thread			
java			
all			

#### **TCP Events**

• TCP transmit, using dynamic tracing:

```
# perf probe tcp_sendmsg
# perf record -e probe:tcp_sendmsg -a -g -- sleep 1; jmaps
# perf script -f comm,pid,tid,cpu,time,event,ip,sym,dso,trace > out.stacks
# perf probe --del tcp_sendmsg
```

- Note: can be high overhead for high packet rates
  - For the current perf trace, dump, post-process cycle
- Can also trace TCP connect & accept
  - Lower frequency, therefore lower overhead
- TCP receive is async
  - Could trace via socket read

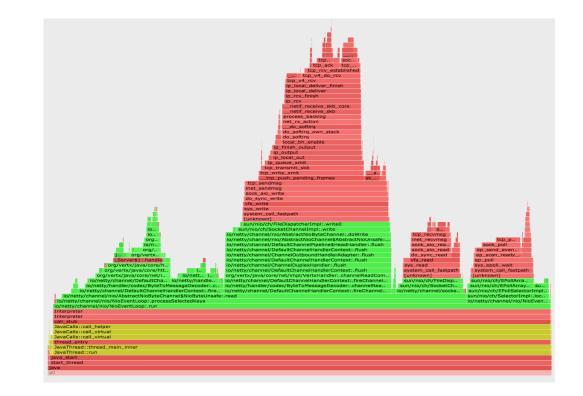

#### **CPU Cache Misses**

• In this example, sampling via Last Level Cache loads:

```
# perf record -e LLC-loads -c 10000 -a -g -- sleep 5; jmaps
# perf script -f comm,pid,tid,cpu,time,event,ip,sym,dso > out.stacks
```

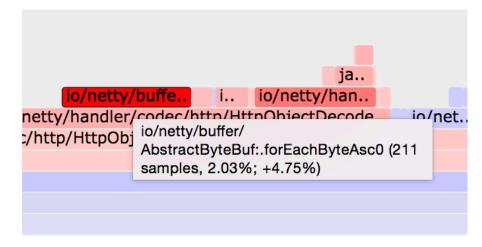

- -c is the count (samples once per count)
- Use other CPU counters to sample hits, misses, stalls

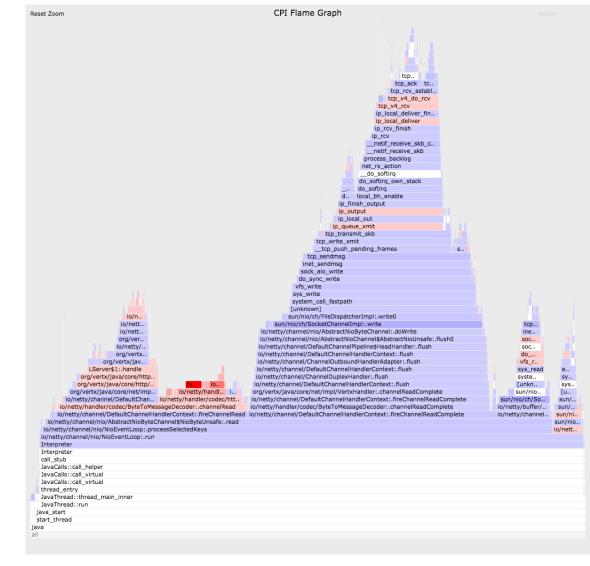

# CPI Flame Graph

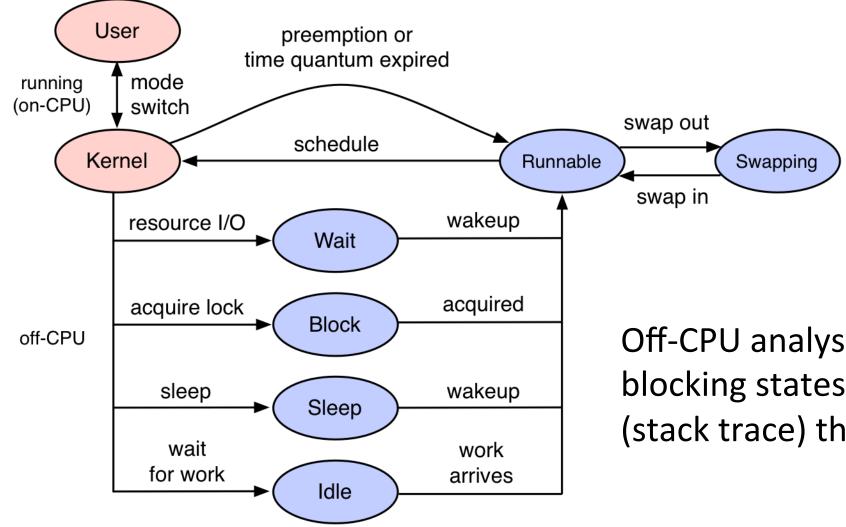

- Cycles Per Instruction
  - red == instruction heavy
  - blue == cycle heavy (likely memory stall cycles)

#### zoomed:

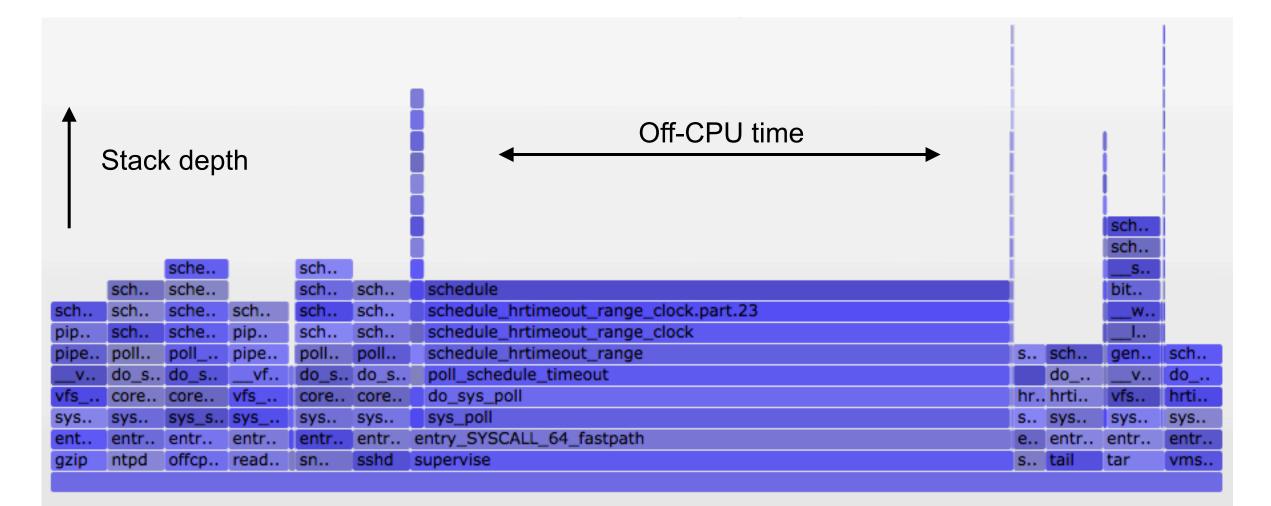

#### **Off-CPU** Analysis

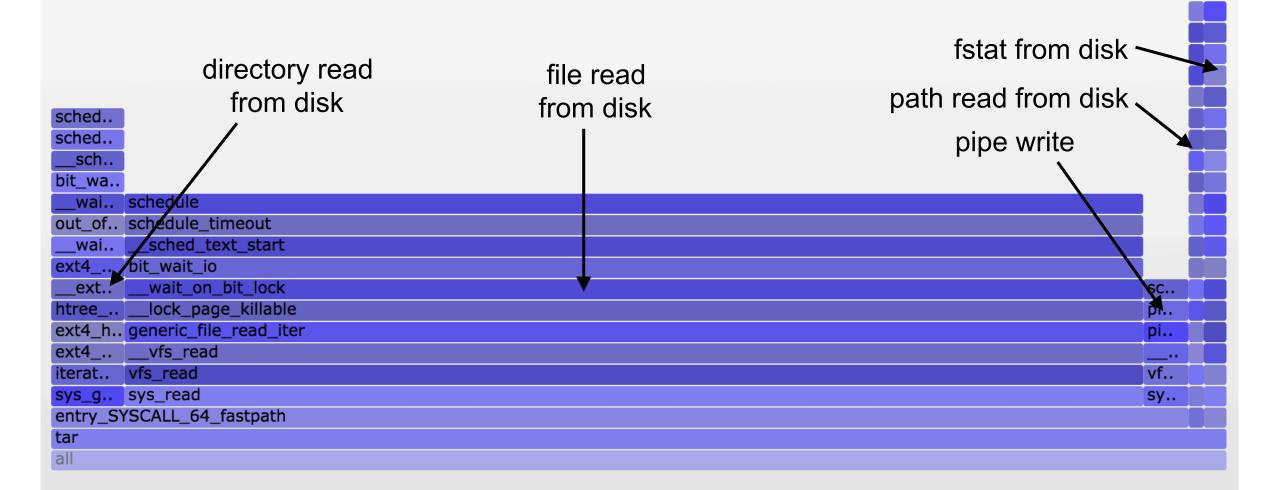

Off-CPU analysis is the study of blocking states, or the code-path (stack trace) that led to these states

#### **Off-CPU Time Flame Graph**

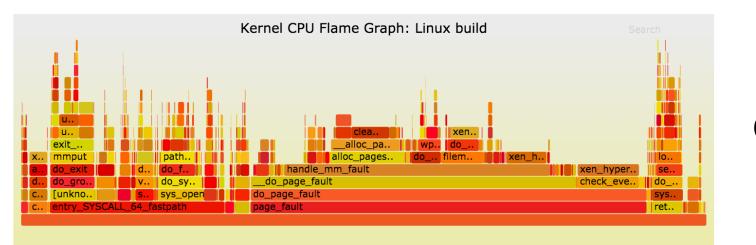

More info http://www.brendangregg.com/blog/2016-02-01/linux-wakeup-offwake-profiling.html

## Off-CPU Time (zoomed): tar(1)

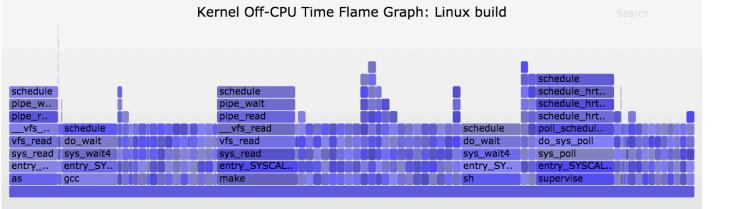

Only showing kernel stacks in this example

#### CPU + Off-CPU Flame Graphs: See Everything

#### Off-CPU

http://www.brendangregg.com/flamegraphs.html

## Off-CPU Time (zoomed): gzip(1)

schedule	
pipe_wait	
pipe_read	
vfs_read	
vfs_read	
sys_read	
entry_SYSCALL_64_fastpath	
gzip	
all	

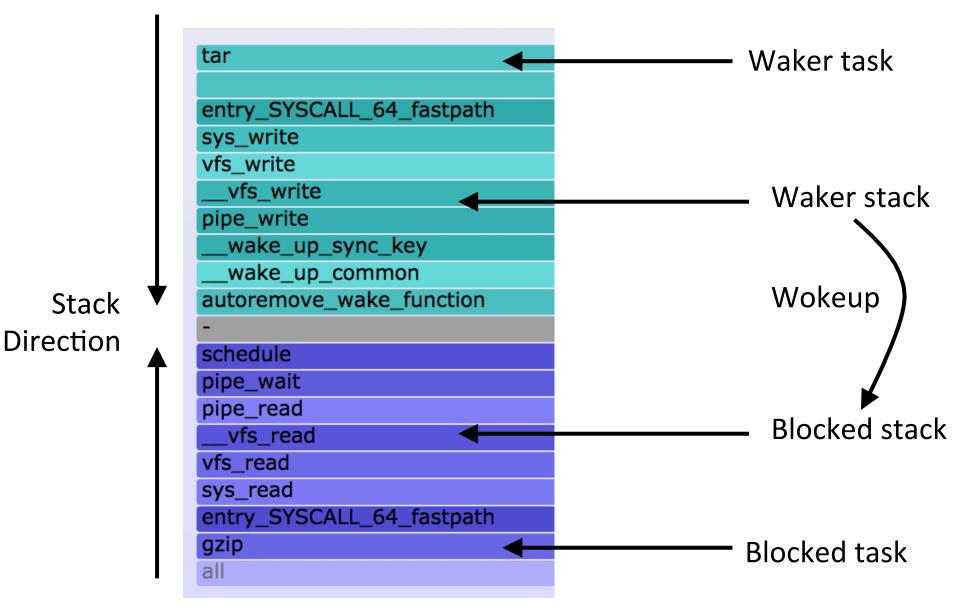

The off-CPU stack trace often doesn't show the root cause of latency. What is gzip blocked on?

Walking the chain of wakeup stacks to reach root cause

## Hot Cold Flame Graphs

#### Includes both CPU & Off-CPU (or chain) stacks in one flame graph

 However, Off-CPU time often dominates: threads waiting or polling

http://www.brendangregg.com/FlameGraphs/hotcoldflamegraphs.html
